

Optional: Stiffen the PVA wings with wire between top and bottom layers. Cut a 12" (30cm) straight piece of stiff, thin wire. Lay it on the inside of the lower wing surface with about 2" (5cm) extending past the inner edge. Glue the top panels in place, sandwiching the wire between panels. When installing the PVA wings to the bus, pierce a small hole in the side of the buss to let the wire pass through then glue the PVA wing tab to the top of the bus. The top deck of the bus will keep the wires and wings from drooping.
